

Checkout System

semicolon

You are tasked with designing a console-based checkout system for a retail store. The system should:

1. Allow customers to enter product names and prices dynamically. Calculate the total cost and apply VAT (7.5%).
2. Generate and display an itemized invoice before requesting payment.
3. Ensure that the payment entered is valid and always greater than the total cost.
4. Print a payment receipt, showing VAT amount, total cost, and balance.

Your program should continuously prompt the customer to enter product names and prices until they indicate they are done. Once all products are entered, the program should display a detailed invoice before requesting payment. If the customer enters an invalid amount (non-numeric or less than the total cost), the program should keep prompting for a valid payment. After entering a valid payment amount, the system should calculate the balance and generate the payment receipt.

Sample Run of the Program

```
Enter product name or type 'done' to finish: Laptop
Enter price for Laptop:  350000

Enter product name or type 'done' to finish:  Mouse
Enter price for Mouse:  10000

Enter product name or type 'done' to finish:  Keyboard
Enter price for Keyboard:  20000

Enter product name or type 'done' to finish: done
```

------ INVOICE ------
Laptop: ₦350,000.00
Mouse: ₦10,000.00
Keyboard: ₦20,000.00

Subtotal: ₦380,000.00
VAT (7.5%): ₦28,500.00
Total Amount: ₦408,500.00

Enter payment amount: 410000

------ PAYMENT RECEIPT ------
Laptop: ₦350,000.00
Mouse: ₦10,000.00
Keyboard: ₦20,000.00

Total Paid: ₦410,000.00
Grand Total: ₦408,500.00
Balance: ₦1,500.00

Payment successful! Thank you for shopping.
